# COMBO-JET<sup>®</sup> Tip-Caps and Strainers

# Are you spending more time cleaning nozzles than spraying?

The **COMBO-JET**® Tip-Cap with snap-in strainer plugs less, is easier to clean, and stays clean longer.

### **COMBO-JET® Drift Reduction - Closed Chamber Design**

Unlike air-induction nozzles, **COMBO-JET**<sup>®</sup> SR, MR, and DR series of tip-caps do not rely on a steady stream of air to reduce drift. Wilger uses a unique pre-orifice and closed chamber design that reduces drift while creating more meaningful droplets.

Each of the **COMBO-JET**<sup>®</sup> drift reduction series (SR/MR/DR) provide different levels of drift reduction and coverage, so you have more flexibility in choosing a tip that fits your application. Without needing consistent airflow for controlling drift, **COMBO-JET**<sup>®</sup> tips have become the preferred tip for Pulse Width Modulation (PWM) spraying systems.

For an example of comparison between the four **COMBO-JET**<sup>®</sup> tip-cap series, see the next page, or use Tip Wizard found on the wilger.net website or Tip Wizard smartphone app.

ER110-04

# If you are tired of picking parts out of the dirt, you will really like COMBO-JET<sup>®</sup> Tip-Caps!

Since the strainer, O-ring, and tip-cap all snap together tightly, dislodged debris cannot plug the tip while changing or cleaning.

**COMBO-JET**<sup>®</sup> tip-caps handle as one piece, so they are safer & easier to use.

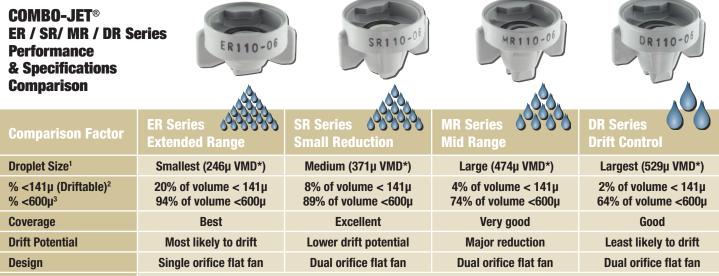

0-

# Not sure which tips to use? Make it easy with Tip Wizard.

Tip Wizard is available on the wilger.net website as well as a FREE smartphone app. Enter your application to receive crucial information to help you make your tip selection and spraying decisions.

# **COMBO-JET® ER, SR, MR, & DR Tip-Caps** *What is the difference?*

Each *chemical, crop, and application* are different. For best application efficacy, each might use a different spray tip. Wilger engineered four series of tip-caps to best match any application to its ideal spray tip. As an example of how each tip series (ER/SR/MR/DR) compare, see the below chart, referencing the -06 tip size:

All-in-one Tip-Cap. Strainer & Pre-orifice (SR, MR, & DR) snap into Tip-Cap.

<sup>1</sup>Based on an XX110-06 nozzle @ 40 psi (2.75 BAR)

<sup>2</sup>Droplets smaller than 141µ are more likely to drift. 141µ is used as a standard for determining driftable fines.

<sup>3</sup>Droplets smaller than 600µ will provide better coverage. Droplets larger than 600µ use more spray volume, potentially reducing coverage.

# Protect yourself by using the correct spray tip.

Minimizing crop damage and maximizing chemical efficacy means more than just impacting the crop. Proper spraying is an important aspect of every farm's bottom line, both financially and environmentally.

Each field's spray conditions can differ greatly, so it is imperative that spray tips match those conditions

To achieve the best application control, ER/SR/MR/DR **COMBO-JET**<sup>®</sup> tip-caps can match the ideal droplet size for any spraying conditions.

# A word or two on multi-tip spraying.

Using a single spray tip to apply high volume applications produces larger droplets, that can result in poor coverage. This is especially true with faster sprayers and higher application rates.

To maintain effective application while minimize coverage loss, use multiple spray tips at the same time. Effectively, each tip makes more meaningful droplets [for coverage], resulting in finer coverage. When used with **COMBO-JET**<sup>®</sup> drift reduction tip-caps, you have the ultimate configuration for any application.

Serviceability

Aside from coverage-sensitive chemicals, multi-tip spraying is also useful for "hard to reach" applications, such as spraying both sides of a head of wheat.

For applying chemical on both sides of a head of wheat, use a dual tip adapter [left], or for hard to reach applications like pigweed (amaranth), use **COMBO-RATE**<sup>®</sup> stacking nozzle bodies [right] to maximize canopy penetration.

# Did you know that size matters?

A 500 micron( $\mu$ ) droplet contains the same volume as 8x 250 $\mu$  diameter droplets, and halving those 8 droplets would make 64x 125 $\mu$  droplets. That is why with smaller droplets, with the same flow rate, you get finer coverage.

# **COMBO-JET® 80° Tip-Cap Performance Specifications**

Size of the median droplet in microns ( $\mu$ ) for a sprayed volume. Half of the volume is made up of droplets smaller than the VMD; half is made up of droplets larger.

4

Percentage of volume which is likely to drift. 200µ is shown for reference.  $141 \mu$  is used as the new standard for driftable fines.

new standard for driftable fines.

Percentage of volume which is made up of 'useful' droplets. As the distribution of useful droplets lowers, coverage is reduced.

Recommended Strainer mesh Mesh of strainer determined by the size of a tip. For larger tips (08+), strainers are not required.

Droplet Categories as per ASABE S572.1 Classification (2009-current) Fine Medium Coarse

341-403µ

Extremely Fine Very Fine <60

### VMD

Volume Median Diameter Size of the median droplet in microns ( $\mu$ ) for a sprayed volume. Half of the volume is made up of droplets smaller than the VMD; half is made up of droplets larger.

### % <141µ % Driftable Fines Percentage of volume which is likely to drift. 141µ is now replacing 200µ as the new standard for driftable fines.

106-235µ 236-340µ

60-105µ

% **<200**µ

404-502µ

% Driftable Fines Percentage of volume which is likely to drift. 200 $\mu$  is shown for reference. 141 $\mu$  is used as the new standard for driftable fines.

Very Coarse Extremely Coarse 503-665µ

% **<600**µ

% Useful Droplets

Percentage of volume which is made up

of 'useful' droplets. As the distribution of useful droplets lowers, coverage is

reduced.

#### Ultra Coarse >665µ

### Strainer Mesh & Tips

Recommended Strainer mesh Mesh of strainer determined by the size of a tip. For larger tips (08+), strainers are not required. For PWM systems, typically 80 mesh inline strainers are used as well.

\*Droplet categories: The above chart is based on the ASABE Standard 572.1. Refer to chemical label to verify which ASABE S572.1 categories should be followed.

Medium

236-340µ

Extremely Fine Very Fine <60 60-105µ

b

### **Recommended Pressure**

Pressure Range for Tips For PWM systems, the pressure loss through system components is accounted for in these charts. Specified pressure in chart is boom pressure. Additional solenoid wear may occur for pressures above 60PSI.

ASABE Droplet Categories
Color Classifications
The colors associated with the VMD is
ased on an ASABE standard for droplet
hre seinonates and

Fine

106-235µ

colors above. Refer to wilder net for older ASABE standard S572.

341-403µ **Duty Cycles** 

Droplet Categories as per ASABE S572.1 Classification (2009-current)

Coarse

Effective run time of PWM Since PWM systems hold pressure of time the solenoids stay open (the duty cycle). Duty cycle is calculated by dividing for that tip. Ideal operating duty cycles are 40-100%

**Pre-orifice Length & Color** Differences in tip pre-orifices Pre-orifice color and length vary for some tips. SR-series pre-orifices will vary in color from the color of the cap. MR & DR pre-orifices will be the same color as the cap. Pre-orifices for high volume tips use a longer pre-orifice.

Very Coarse

404-502µ

Extremely Coarse 503-665µ

### **Using Tip Wizard**

Same search, different results PWM systems use plumbing components that cause more in pressure loss when compared to standard spray systems. Tip Wizard accounts for those pressure drops, and also provides crucial duty cycle information as well.

Ultra Coarse

>665µ

# constant, they adjust rates by the length your current speed into the max speed

# Multi-tip spraying with Pulse Width Modulation Technology

Pulse Width Modulation (PWM) provides the ability to hold tip pressure constant; therefore, holding the droplet size constant as well. This holds true with multi-tip spraying as well.

As a standard, PWM systems use one solenoid per nozzle body. For best utilization of PWM technology, a dual tip adapter [left] is used.

Spraying with two seperate outlets [right] is possible, but the outlet not controlled by a solenoid will be controlled by the auto-rate controller.

To use Tip Wizard to help select a multi-tip setup, simply split the total flow rate into two (or more) parts and ensure the tips selected can operate within the same duty cycle range and pressures.

Example Rate: 10 Imp Gal/Acre; Speed: 15 MPH; Nozzle Spacing: 20"; Target Droplet Size: 400 microns (Systemic Herbicide)

If the total application is 10 IGPA, the effective rates per tip must add up to 10 IGPA. For simplicity, split the flow in equal parts; for example, two tips applying 5 IGPA. While consulting the tip charts, a suitable choice might be the MR80-04 at 40 PSI with an effective volume of 5 IGPA per tip. The droplet size is right around 400µ, and travel speed at max speed (19.3MPH) is roughly at a 78% duty cycle.

Droplet Categories as per ASABE S572.1 Classification (2009-current) Very Fine Fine Medium Coarse

106-235µ 236-340µ

341-403µ 404-502µ

Very Coarse Extremely Coarse 503-665µ

Ultra Coarse >665µ

### VMD

Extremely Fine

<60

Volume Median Diameter Size of the median droplet in microns ( $\mu$ ) for a sprayed volume. Half of the volume is made up of droplets smaller than the VMD; half is made up of droplets larger.

8

% <141µ % Driftable Fines Percentage of volume which is likely to drift. 141µ is now replacing 200µ as the new standard for driftable fines.

60-105µ

### % **<200**µ

% Driftable Fines Percentage of volume which is likely to drift. 200µ is shown for reference. 141µ is used as the new standard for driftable fines.

% **<600**µ % Useful Droplets Percentage of volume which is made up of 'useful' droplets. As the distribution of useful droplets lowers, coverage is reduced.

Strainer Mesh & Tips

Recommended Strainer mesh Mesh of strainer determined by the size of a tip. For larger tips (08+), strainers are not required.

# 110° Tip-Cap Specifications Standard Spray Systems

# **COMBO-JET® 110° High Flow Tip-Cap Performance Specifications**

\*Droplet categories: The above chart is based on the ASABE Standard 572.1. Refer to chemical label to verify which ASABE S572.1 categories should be followed.

Droplet Categories as per ASABE S572.1 Classification (2009-current) Very Coarse Extremely Coarse Very Fine Fine Medium Coarse Ultra Coarse Extremely Fine <60 60-105µ 106-235µ 236-340µ 341-403µ 404-502µ 503-665µ >665µ **Combo-Jet® Adapters** ASABE Droplet Categories **Recommended Pressure** Pre-orifice Length & Color Pressure Range for Tips Square Lug Compatibility Color Classifications Differences in tip pre-orifices The colors associated with the VMD is Combo-Jet® tip-caps use a radialock For applications which require a uniform Pre-orifice color and length vary for some O-ring seal to secure the cap to the based on an ASABE standard for droplet pattern, the recommended pressure range tips. SR-series pre-orifices will vary in nozzle body. Adapters are available to size categorization. See categories and is provided. Specified pressure in chart is color from the color of the cap. MR & DR mount a radialock cap on a non-radialock colors above. Refer to wilger.net for older boom pressure. pre-orifices will be the same color as the ASABE standard S572. cap. Pre-orifices for high volume tips use nozzle body. a longer pre-orifice. New for 2017

# Have you tried the TIP WIZARD?

An easy to use spray tip calculator that helps find the best spray tip for your application. It is as easy as entering your application, and seeing the results. Tip Wizard is available on the wilger.net website, FREE smartphone app, and Wilger USB.

Droplet Categories as per ASABE S572.1 Classification (2009-current) Fine Medium Coarse Very Coarse 341-403µ

Extremely Fine Very Fine <60

### VMD

Volume Median Diameter Size of the median droplet in microns ( $\mu$ ) for a sprayed volume. Half of the volume is made up of droplets smaller than the VMD; half is made up of droplets larger.

### % <141µ % Driftable Fines Percentage of volume which is likely to drift. 141µ is now replacing 200µ as the new standard for driftable fines.

106-235µ 236-340µ

60-105µ

% **<200**µ % Driftable Fines 404-502µ

Percentage of volume which is likely to drift. 200 $\mu$  is shown for reference. 141 $\mu$  is used as the new standard for driftable fines.

Extremely Coarse 503-665µ

% **<600**µ

% Useful Droplets

Percentage of volume which is made up

of 'useful' droplets. As the distribution of useful droplets lowers, coverage is

reduced.

Ultra Coarse >665µ

### Strainer Mesh & Tips

Recommended Strainer mesh Mesh of strainer determined by the size of a tip. For larger tips (08+), strainers are not required. For PWM systems, typically 80 mesh inline strainers are used as well.

\*Droplet categories: The above chart is based on the ASABE Standard 572.1. Refer to chemical label to verify which ASABE S572.1 categories should be followed.

Medium

■ Extremely Fine <60 ■ Very Fine 60-105µ

### Recommended Pressure

Pressure Range for Tips For PWM systems, the pressure loss through system components is accounted for in these charts. Specified pressure in chart is boom pressure. Additional solenoid wear may occur for pressures above 60PSI. 60-105µ 106-235µ 236-340µ ASABE Droplet Categories Color Classifications The colors associated with the VMD is based on an ASAE standard for droplet constant dire conterviting. See active constant of time the

Fine

size categorization. See categories and colors above. Refer to wilger.net for older ASABE standard S572.

### 341-403µ Duty Cycles

Droplet Categories as per ASABE S572.1 Classification (2009-current)

Coarse

Effective run time of PWM Since PWM systems hold pressure constant, they adjust rates by the length of time the solenoids stay open (the duty cycle). Duty cycle is calculated by dividing your current speed into the max speed for that tip. Ideal operating duty cycles are 40-100%.

404-502µ 503-665µ Pre-orifice Length & Color Differences in tip pre-orifices Pre-orifice color and length vary for some tus. SR-series pre-orifices will vary in

Extremely Coarse

Very Coarse

Pre-orifice color and length vary for some tips. SR-series pre-orifices will vary in color from the color of the cap. MR & DR pre-orifices will be the same color as the cap. Pre-orifices for high volume tips use a longer pre-orifice. ■ Ultra Coarse >665µ

#### Using Tip Wizard

Same search, different results PWM systems use plumbing components that cause more in pressure loss when compared to standard spray systems. Tip Wizard accounts for those pressure drops, and also provides crucial duty cycle information as well.

# Multi-tip spraying with Pulse Width Modulation Technology

Pulse Width Modulation (PWM) provides the ability to hold tip pressure constant; therefore, holding the droplet size constant as well.

As a standard, PWM systems use one solenoid per nozzle body. For best utilization of PWM technology, a dual tip adapter [left] is used.

Spraying with two seperate outlets [right] is possible, but the outlet not controlled by a solenoid will be controlled by the auto-rate controller.

To use Tip Wizard to help select a multi-tip setup, simply split the total flow rate into two (or more) parts and ensure the tips selected can operate within the same duty cycle range and pressures.

Example Rate: 10 Imp Gal/Acre; Speed: 15 MPH; Nozzle Spacing: 20"; Target Droplet Size: 400 microns (Systemic Herbicide)

If the total application is 10 IGPA, the effective rates per tip must add up to 10 IGPA. For simplicity, split the flow in equal parts; for example, two tips applying 5 IGPA. While consulting the tip charts, a suitable choice might be the MR110-04 at 40 PSI with an effective volume of 5 IGPA per tip. The droplet size is right around 400µ, and travel speed at max speed (19.3MPH) is roughly at a 78% duty cycle.

# **Spray Tips**

### **Drift vs. Efficacy**

[]

Generally speaking, smaller droplets deposit on the target more effectively than larger droplets, but larger droplets will drift less. So, when balancing drift control and efficacy, ensure to consider chemical labels and guidelines to designate the required droplet size/category. Find the below chart as an illustration showing the general differences in how different droplet sizes are required for different applications.

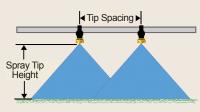

Droplet Size VMD Range	ASABE S-572.1 Classification Category	Color Code	Contact Insecticide & Fungicide	Systemic Insecticide & Fungicide	Contact Foliar Herbicide	Systemic Foliar Herbicide	Soil-Applied Herbicide	Incorporated Soil-Applied Herbicide	Fertilizer
Under 60	Extremely Fine (XF)	Purple							
60-105	Very Fine (VF)	Red							
106-235	Fine (F)	Orange							
236-340	Medium (M)	Yellow							
341-403	Coarse (C)	Blue							
404-502	Very Coarse (VC)	Green							
503-665	Extremely Coarse (XC)	White							
Over 665	Ultra Coarse (UC)	Black							

The above table provides general guidelines regarding chemical efficacy vs. droplet size.

It is always recommended that you carefully read and follow the chemical manufacturers application label and instructions.
